DETAILED ACTION

Applicant's request for reconsideration filed 04/11/07 has been entered and carefully considered. Arguments regarding rejection under 35.U.S.C 103 to claims (1-38) have been found to be persuasive. However, these claims have not been found to be patentable over prior art of record. Claims 1-38 are rejected under the new ground of rejection as set forth below.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-38 are rejected under 35 U.S.C. 102(b) as being anticipated by Dev et al. [US.5,504,921].

As to claims 1 and 21, Dev et al. shows a communications network having first means for receiving communication of original messages generated from one or more network element subsystems (column 3, lines 38-55 and column 13, lines 1-15), the network element subsystems including console connections and application connections (column 5, lines 1-10, console connections and application connection would be one of the parts in the network);

Art Unit: 2179

60).

means for mapping text of a received original message to one or more of a plurality of alarm attributes (column 4, lines 54-65 and column 12, lines 32-50) and means for determining the presence of an alarm condition from said one or more attributes (column 8, lines 27-55) and generating one or more responses according to said type of alarm condition (column 8, lines 41-55); means for enabling a remotely located user access to said one or more network elements via a display interface at a remote terminal (column 3, lines 28-55) and a said response including automatically presenting said remotely located user of an alarm condition at a network element via said display interface, said remotely located user being enabled to access said network element from said remote terminal for further responsive action thereof (column 14, lines 41-60). As to claims 2 and 20, Dev et al. discloses said first server means includes a terminal server means physically connected to a console port I/O of each said network element, said remotely located user having access to said console port via said user interface (column 4, line 65 through column 5, line 1-17). As to claims 3 and 23, Dev et al. shows the first server means includes means for receiving communication of original textual messages from a network application running on said network element, said first server means including a mailbox facility means for receiving said alarm messages (column 3, lines 35Application/Control Number: 10/725,505

Art Unit: 2179

As to claim 4, Dev et al. teaches the network application running on said network element is a Log Management Facility application (column 3, lines 1-60).

As to claims 5 and 24, Dev et al. discloses means for presenting an indication of said alarm condition to said remotely located user via a network connection (column 2, lines 50-64).

As to claims 6 and 25, Dev et al. shows "graphical icon being color-coded to indicate alarm condition severity" (column 12, lines 16-67).

As to claim 7, Dev et al. demonstrates the terminal server means including a telnet terminal server (column 5, lines 1-10).

As to claim 8, Dev et al. teaches means for enabling a remotely located user access to said one or more network elements includes a network connection (column 2, lines 35-67).

As to claims 9 and 27, Dev et al. shows network socket connection is pursuant to a TCP/IP protocol (column 3, lines 28-62).

As to claims 10 and 8, Dev et al. discloses means for mapping text of a received original message to one or more of a plurality of alarm attributes includes utilizing regular expression matching (column 9, lines 40-65).

As to claims 11 and 29, Dev et al. teaches the message attributes include one or more selected from the group comprising: originating network element, time, alarm severity level, alarm mnemonic, alarm description, process name, and network element name (column 8, lines 1-13).

Application/Control Number: 10/725,505

Art Unit: 2179

As to claims 12 and 30, Dev et al. discloses means for determining presence of an alarm condition from said one or more attributes includes means for applying configuration rules to said alarm attributes, said configuration rules stored as text in a first storage means at or near said first means and accessible therefrom (column 9, lines 40-65 and column 12, lines 15-51). As to claims 13 and 31, Dev et al. teaches text editor means for enabling a user to modify existing configuration rules stored in said storage means via said user display interface, said text editor means further enabling said user to generate new configuration rules for storage in said storage means, said new configuration rules creating a new alarm condition (column 9, lines 5-67). As to claims 14,15,32 and 33, Dev et al. shows configuration rules further provides a sifting operation for sifting through said attributes to match said alarm condition with a pre-determined alarm condition and the sifting means operation enables an alarm message to be terminated if a match with a pre-determined alarm condition is found (column 14, lines 41-60). As to claims 16,17,34 and 35, Dev et al. teaches configuration rules further

As to claims 16,17,34 and 35, Dev et al. teaches configuration rules further provide a logging operation for automatically logging alarm conditions in a second storage means at or near said first means and accessible therefrom and means for generating reports including past alarm conditions stored in said second storage means (column 9, lines 43-67).

As to claims 18 and 19, Dev et al. discloses a response action includes initiating transmission of an e-mail message and a response action includes

Application/Control Number: 10/725,505

Art Unit: 2179

initiating transmission of a paging message and command procedure (column 11, lines 40-55).

As to claim 22, Dev et al. shows providing a physical connection between each said network element and a terminal server device enabling remote access to said one or more network elements via said user display interface (column 3, line 35-through column 4, line 15).

As to claim 26, Dev et al. show providing a network socket connection to enable said remotely located user access to said one or more network elements (column 3, lines 62).

As to claim 28, Dev et al show the step of mapping text including utilizing regular expression matching (column 8, lines 30-55).

As to claim 36, Dev et al. teaches a transaction server and a communications server; the transaction server and communications server and to transmit the same over a network link (column 5, lines 1-17); a telecommunications network alarm monitoring server linked to the terminal server of the service control point over the network link; a network alarm monitoring process to map the event messages to an alarm data structure and a network link to the telecommunications network alarm monitoring server to enable transmission of messages by the network alarm monitoring server in response to recognized alarm condition (column 3, lines 38-55 and column 13, lines 1-15)

As to claim 37, Dev et al. teaches access is enabled to the terminal server is over an Internet Protocol network (column 4, lines 1-15).

Application/Control Number: 10/725,505 Page 7

Art Unit: 2179

As to claim 38, the claim is analyzed as previously discussed with respect to claims 36 and 37.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mylinh Tran. The examiner can normally be reached on Mon - Thu from 7:00AM to 3:00PM at 571-272-4141.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Weilun Lo, can be reached at 571-272-4847.

The fax phone numbers for the organization where this application or proceeding is assigned are as follows:

571-273-8300

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
